Field Force Insights Report - Respiratory, Q3 (SYNTHETIC - internal mock)

Summary

142 paediatricians and 96 pulmonologists interviewed across 11 cities. 63% report poor adherence to montelukast chewable tablets among children under 6 due to taste and dosing frequency. 41% would prescribe a film formulation if priced within 15% of the tablet.

Unmet needs heard in the field

Post-viral chronic cough lasting over 8 weeks is rising and has no approved therapy; physicians use montelukast off-label with mixed results. Bronchiectasis patients lack affordable inhaled antibiotics. Neuropsychiatric adverse event warnings for montelukast worry 28% of prescribers - a risk-management programme would be a differentiator.

Competitive notes

46 brands of montelukast compete in India; none has a film. Two competitors are rumoured to be developing granule sachets.
